Backend Member 5 - Auth, Security & Admin Configuration

Project Role: Securing the application, managing user identities, and building the backend management interfaces.

Core Technologies: Python, Django Authentication, Django Admin.

- **Weeks 1-3 (Sandbox & Setup):** Learn how Django handles user authentication. Practice setting up the default Django Admin panel and explore Django's built-in email sending tools.
- **Weeks 4-6 (Foundation):** Implement custom User models if necessary. Configure the Django Admin Panel so that content can be added or edited manually. Set up secure password hashing (ensuring no plaintext passwords are stored).
- **Weeks 7-10 (Core Features Auth):** Develop the User Registration and Login endpoints. Implement the Email OTP generation and verification flow for forgot password requests.
- **Weeks 11-13 (Advanced Features Admin):** Configure the Super Admin panel to assign roles and manage permissions. Create the secure endpoints for updating user profile pictures and names.
- **Weeks 14-16 (Polish & QA):** Conduct a security review of all API endpoints to ensure non-authenticated users cannot access private itinerary data. Finalize the IT Support ticketing interface.
